Methods of test for pallet joints —

Part 1:

Determination of bending resistance of pallet
nails, other dowel-type fasteners and staples

Méthodes d'essai des assemblages de palettes —

*Partie 1: Détermination de la résistance à la flexion des clous et autres
éléments de fixation de type cheville, et des clous cavaliers*

Reference number
ISO 12777-1:1994(E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 12777-1 was prepared by Technical Committee ISO/TC 51, *Pallets for unit load method of materials handling*.

ISO 12777 consists of the following parts, under the general title *Methods of test for pallet joints*:

- *Part 1: Determination of bending resistance of pallet nails, other dowel-type fasteners and staples*
- *Part 2: Testing of nails and staples for withdrawal and head pull-through resistance*
- *Part 3: Determination of bending strength*
